

Green Generation

The "**Green Generation**" program is designed for students in secondary education, aiming to introduce them to career opportunities related to environmental protection and sustainable development. At the same time, it raises their awareness of critical environmental issues.

Specifically, participants engage in live group sessions with mentors who work in green professions that promote sustainable behavior and environmental stewardship. Within this framework, they explore the realities and career prospects of environmentally related professions, discussing the importance of sustainability.

Inspired by the mentors' professional experiences, students then take part in experiential learning activities that foster creativity and encourage them to take on roles and initiatives aimed at promoting environmental protection. Their goal is to develop ideas for reducing their school's environmental footprint.

The program is implemented with the support of **METLEN** for the school year 2025-26.
